Detailed Action

This office action is in response to Applicant's communication filed on 4/4/08.

IDS

The information disclosure statement (IDS) filed on 6/16/08 is in compliance with the provisions of 37 CFR 1.97. Accordingly, the information disclosure statement is being considered by the examiner.

Allowed Claims

Claims 2-4 are allowed over the prior art of record.

Examiner's Amendment

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Robert Jacobsen on 7/2/08.

The application has been amended as follows:

1. For claim 2, page 2, line 26, the following is deleted:

"wherein a supply source of said element A for preparing the catalyst is a composite of at least one element selected from among cobalt, nickel, iron, lead and bismuth and at least one element selected from among molybdenum, vanadium, and copper."

And the following is inserted:

—wherein said composite-oxide catalyst is prepared by the steps of:

- a) uniting a starting material for element A with a starting material selected from among molybdenum, vanadium, and copper to form a united material, then optionally drying said united material and optionally heating said dried material, such that a composite A is obtained;
- b) mixing said composite A and starting materials for other elements to obtain a starting material mixture containing said composite A;
- c) drying said starting material mixture containing said composite A to obtain a dried material containing said composite A; and
- d) calcining said dried material containing said composite A to obtain said composite-oxide catalyst —

Reason for Allowance

Applicant's claimed invention is directed to a process for the production of acrylic acid by a catalytic gas phase oxidation reaction of acrolein with molecular oxygen to produce acrylic acid, in the presence of a composite-oxide catalyst of the general formula (I). The composite-oxide catalyst is prepared through a catalyst precursor, called composite A, which contains selected elements of the catalyst composition, and is prepared beforehand as a supply source for the resulting composite-oxide catalyst.

The closest prior art is Kawajiri et al. (US 5,719,318). Kawajiri et al. teaches a process for production of acrylic acid by carrying out a catalytic gas phase oxidation reaction of acrolein with molecular oxygen to produce acrylic acid, in the presence of a composite-oxide catalyst, which includes molybdenum, vanadium, tungsten, copper, iron, antimony, tin, titanium and zirconium.

Kawajiri et al. is deficient in that it does not teach a catalyst made from a catalyst precursor.

The Applicant has demonstrated that the instantly claimed method of making the catalyst through the catalyst precursor of composite A, contributes to the unexpected result of an increase in the catalyst lifetime by approximately 46%, see comparative data in table 1 on page 24 of the specification.

The prior art neither teaches, nor suggests the limitations of Applicant's claims as described above. Nor would it have been obvious to modify the prior art's process steps to arrive at the instantly claimed invention. There is no motivation to do so.
